

Aftershock Distribution and the Mainshock's Fault Plane by the MJHD Method: Application to the Iran-Pakistan Border Region Earthquake on April 16, 2013

2013/04/18

HURUKAWA Nobuo

IISEE, Building Research Institute (BRI), Japan

Earthquake Information (USGS)

Origin Time: April 16, 2013 at 10:44:20 UTC

Hypocenter: 28.107°N, 62.053°E, 82 km (depth)

Magnitude: $M = 7.8$

Data: 'Latest Earthquakes in the World - Past 7 days' by the US Geological Survey

Events Relocated: Mainshock and aftershocks until April 17

Method: Modified Joint Hypocenter Determination (MJHD) by Hurukawa and Imoto

Results: Length of aftershock area: 60 km

Fault plane: Nodal plane striking EW dipping S

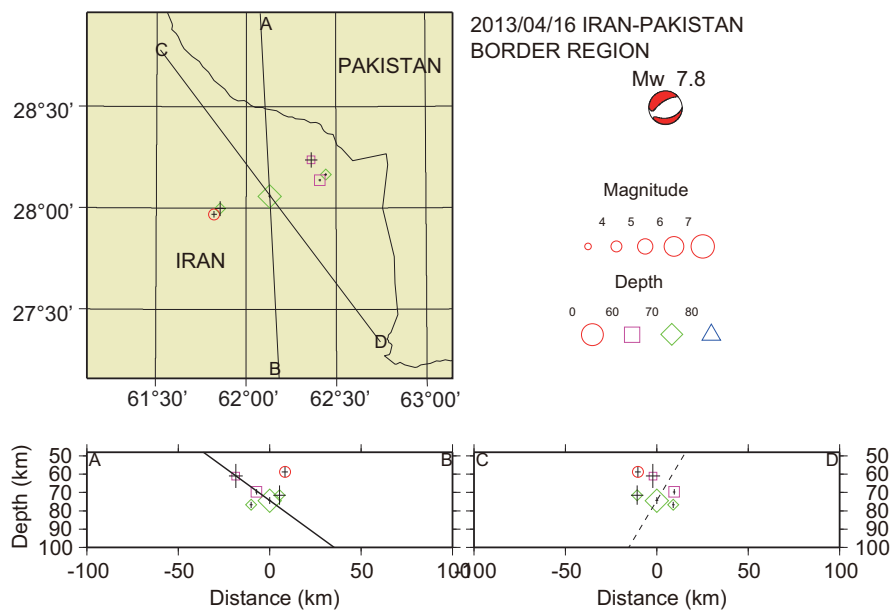

Figure 1. Hypocenters relocated by the MJHD method. USGS W-Phase moment-tensor solution of the mainshock is also shown. Epicentral distribution and two vertical cross sections along A-B and C-D lines, which are perpendicular to strikes of the two nodal planes of the mainshock, are shown. Two nodal planes are shown by lines in cross sections. The nodal plane corresponding to the fault plane is shown by a thick solid line.

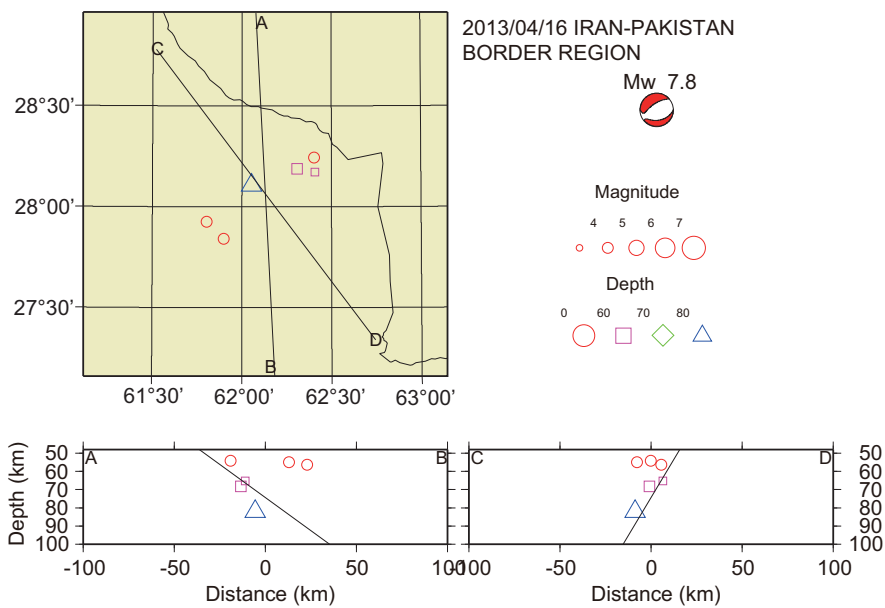

Figure 2. Hypocenters located by the USGS. Two nodal planes of the mainshock are also shown by solid lines in cross sections.

Figure 3. Stations used in relocation.
